

PROJECT OVERVIEW

The operating system for everything you move.

Freight, passengers and the paperwork around both — one platform where fleet owners, drivers, suppliers, travel operators and customers work off the same record.

INTERNAL ONBOARDING DOCUMENT

FOR NEW COLLEAGUES · ~12 MINUTE READ

SEPTEMBER 2026 · PLATFORM V0.1.0

One record for a business that moves things.

Road transport in India runs on phone calls, WhatsApp groups and paper registers. The load exists in one person's head, the vehicle's papers in a folder, the driver's whereabouts in a missed call. Saarthi puts all of it in one place — and lets the people on either side of a job see the same thing at the same time.

01

Nobody can see the vehicle

A customer rings to ask where their load is. The dispatcher rings the driver. Both answers are guesses, and neither is written down.

02

Work is found by phone

Loads and return legs are matched through brokers and personal contacts, so a fleet with a spare truck and a customer with a load never meet.

03

Paper stops trucks

Insurance, permits, fitness, licences, EMIs and FASTag all expire on their own schedule. The one nobody noticed is the one that halts the vehicle.

Not a truck product

Trucks, tippers, buses, taxis, vans and auto-rickshaws all run on the same platform. What a vehicle is allowed to do is decided by its declared capabilities, not by its badge — so freight and passenger businesses share one system.

GOODS CARRIER · TIPPER · BUS · SUV · TAXI · AUTO — ONE PLATFORM

● Operators

Fleet owners and managers who want one command centre instead of six ledgers.

● Drivers

Help within reach, a score that explains itself, and a record that follows them.

● Customers

Post a need, compare real quotes, then watch the actual vehicle arrive.

● Suppliers & operators

Material yards and travel businesses selling into the same marketplace.

KEY TAKEAWAY Saarthi is not a tracking app with extras bolted on. It is the operating record of a transport business — the work, the vehicles, the people, the money and the paperwork — with live location as one of the things that record knows.

From a need on the ground to a job that can be proved.

STAGE 01

People & vehicles

- A customer with something to move
- A fleet, supplier or travel operator with capacity
- A driver in a cab
- Vehicles, fitted trackers and tablets

STAGE 02

The Saarthi applications

- **Web platform** — the office and the marketplace
- **Vehicle terminal** — the in-cab cockpit
- **Device app** — a phone acting as a tracker
- Everything in the user's own language

STAGE 03

Core platform services

- Who you are, and what you may see
- Requirements, bidding, orders, trips
- Location, safety and alerting
- Documents, money and compliance

STAGE 04

Records & outside services

- One operational database of record
- Maps, routing and places
- Registry, licence and identity checks
- Fuel prices, toll, finance, assistance

STAGE 05

What the business gets

- Work won, and return legs filled
- A vehicle that is never quietly non-compliant
- A driver who can call for help
- Numbers that come from the records

↓ Instructions travel down

A customer's requirement becomes a bid, an award, an order and then a trip assigned to a named vehicle and driver. Each step is a state the platform recognises, not a message someone has to remember to pass on.

↑ Evidence travels back up

Positions, sensor readings, photographs, signatures, fuel fills and toll crossings come back from the road and attach to the same job — so the trip's story is assembled as it happens rather than reconstructed afterwards.

KEY TAKEAWAY Every screen in Saarthi is a view onto one shared record. The customer, the fleet and the driver are not exchanging updates — they are looking at the same job from three different seats.

Twelve named roles. Seven kinds of account.

A role decides what a person can do; an organization decides whose data they can see. The two are separate, which is why one person can hold a job at a fleet and a seat at an association without the two ever mixing.

ON THE PLATFORM

Fleet owner

OPERATOR

"I know what is happening across my whole operation."

Runs the vehicles and the people. Owns the commercial side: what work is taken, who drives it, and what it cost.

Vehicles & drivers Bid for work Dispatch

Driver

ON THE ROAD

"I am not alone on the road."

The person actually moving the vehicle. Sees only their own trip, their own record and what is around them.

Current trip One-tap SOS Own score

Customer

DEMAND SIDE

"I know where my order and my truck are."

Anyone with something to move or a journey to book. Needs no vehicle of their own to use the platform.

Post a requirement Compare quotes Track

Supplier

GOODS

"I manage material and transport in one place."

A yard or dealer selling material. Quotes for the goods; a fleet may separately quote to move them.

Catalogue Yard stock Orders

Travel operator

PASSENGERS

"My taxis, buses and tours sell themselves."

Taxi, bus and tour businesses. Publishes passenger packages and runs the vehicles behind them.

Packages Bookings Cab hire

Truck association

RESPONDER

"My district can answer a call for help."

A district body that coordinates roadside assistance. Sees that a vehicle nearby is in trouble — and deliberately nothing else about it.

Emergency desk Responders District alerts

BEHIND THE PLATFORM

Platform admin

Reviews verification submissions, manages organizations and devices, and reads the audit trail. Nothing enters the network unchecked.

Salesperson

Sells Saarthi itself — leads, demos, referrals, tracker handover and their own commission. Sees no customer's operational data.

Support agent

Helps users without owning their business. Fleet managers, dispatchers and association responders sit alongside as scoped variants of the roles above.

KEY TAKEAWAY The interface hides what a person cannot do, and the server refuses it regardless. A request for something belonging to another organization is answered as though it does not exist.

Forty-eight capabilities, in nine families.

Every capability below is a named entitlement the platform knows about, which is how plans, menus and buttons all agree on what an account can reach. A representative few are listed per family.

Tracking & maps

6

Where every vehicle is, where it has been, and what the road ahead looks like.

- Live tracking and history
- Trip replay — scrub back through a finished run
- 3D maps with terrain and buildings

Fleet & trips

5

Vehicles, drivers, trips and the servicing that keeps them earning.

- Fleet management and analytics
- Trip management — assign, run, complete
- Maintenance & service history

Driver & safety

8

The network a driver can reach when something goes wrong, and a score they can question.

- SOS network
- Association network — district responders
- Nearby services, and nearby Saarthi vehicles

Marketplace & loads

6

Finding work, filling the return leg, and moving stock out of a yard.

- Requirements and bidding
- Return loads — backhaul matching
- Stock, relay and city access

Money & compliance

7

Documents, EMI, toll and identity — the paperwork that stops vehicles.

- Documents with expiry tracking
- Loan & EMI schedules
- FASTag, toll and QR identity

Hardware & telemetry

6

Telematics devices, live engine data, and the alerts raised from it.

- Hardware connectivity
- Live telemetry and history
- Telemetry intelligence and alerts

Travel & passengers

2

Taxis, buses and tour packages, sold and booked on the same platform.

- Travel & tours — publish packages
- Travel booking

Intelligence & reporting

6

Analytics, forecasting and an assistant that answers from your own records.

- AI Fleet Copilot — cites what it used
- AI recommendations
- Business intelligence & reports

Platform & integration

2

How Saarthi connects to everything else a business runs.

- API access — planned
- Single sign-on — planned

KEY TAKEAWAY Safety is not sold. SOS is reachable in one tap and is never gated behind a plan — and the platform never claims to replace the emergency services.

Three paths that carry most of the platform.

JOURNEY A A need finds a fleet Customer → Supplier / Fleet / Travel operator → Driver

01 Post a requirement Material, freight, a cab or a tour — one front door, four kinds of need.	02 The right businesses see it Only those that can actually serve that kind of need are shown it.	03 They quote A supplier may quote the goods while a fleet quotes to move them.	04 Customer awards Shortlist, compare, award. Each half of the job can be awarded on its own.	05 Order or booking The award becomes a real fulfilment record with its own history.	06 Trip assigned A named vehicle and a verified driver are put against it.	07 Tracked to the gate Progress, ETA and delay update live for both sides at once.	08 Delivered & rated Completed, rated, and kept as the record of what happened.
--	---	---	---	--	--	--	---

JOURNEY B A driver's day Driver → Vehicle terminal → Fleet

01 Scan the vehicle The tablet in the cab shows that vehicle's permanent Saarthi QR.	02 Identify & photograph The driver signs in with their own account and takes an arrival photo.	03 Fleet approves Somebody at the fleet accepts or rejects the driver on that vehicle.	04 Safety check A pre-trip checklist has to pass before the cockpit will open.	05 Cockpit opens Map, speed, fuel, nearby services, vehicle records and SOS.	06 Drive the trip Position and sensor readings flow back against the job automatically.	07 Help in one tap An SOS reaches the fleet, nearby vehicles and the district association.	08 Trip completed The vehicle returns to waiting for its next driver.
--	---	--	--	--	---	--	---

JOURNEY C Joining the platform Any new business

01 Register Open registration creates an organization and starts a free trial.	02 Choose a plan Free, Personal or Business, priced per vehicle rather than per bundle.	03 Add vehicles & drivers Registration lookup fills in what the authorities already hold.	04 Submit documents Business, vehicle and driver papers, each with its own expiry date.	05 Verification review Approve, reject or request a correction — always with a stated reason.	06 Verified Only verified drivers and vehicles can be put on a trip or offered for work.	07 Fit a tracker Optional: hardware, or a phone acting as one, unlocks live telemetry.	08 Trading Bid for work, run trips, and be found by customers.
--	---	---	---	---	--	--	--

KEY TAKEAWAY Each journey is a sequence of states the platform enforces, not a convention people follow. A trip cannot start from a stage it has not reached, and an unverified driver cannot be put behind a wheel.

One language, top to bottom.

Everything else is a choice.

KNOW THIS FIRST

One shared domain package

The rules that define the business — roles, plan entitlements, state machines, scoring, geography, validation — live in a single package used by the server *and* the browser. A rule cannot mean one thing in the API and another in the interface, because there is only one copy of it.

KNOW THIS SECOND

Everything external sits behind an interface

Storage, notifications, payments, AI, maps, telematics, identity lookups and finance are each reached through a swappable provider. Changing vendor is a configuration change; no business code knows which one is in use.

KNOW THIS THIRD

The map needs no account

Tiles, 3D buildings and terrain come from open data with no key and no quota. Only navigation and place search use a keyed service, and even that has a free tier.

KEY TAKEAWAY TypeScript end to end on the web, Kotlin on the vehicle. The stack was chosen so the same person can follow a rule from the button that triggers it to the row it writes.

Four ways in. One platform. One record.

CLIENTS

BROWSER

Web platform

The office: marketplace, fleet, trips, documents, analytics and administration.

IN-CAB TABLET

Vehicle Terminal

The driver cockpit, fitted to one vehicle and paired to it by QR.

ANDROID PHONE

Device app

A handset acting as a vehicle device — GPS, camera, motion, heartbeat.

FITTED HARDWARE

Telematics units

On-board diagnostics and multi-camera recorders reporting through the same door.

↓ AUTHENTICATED REQUESTS

Data layer

Operational database of record

Cache · pub/sub · locks

Document & media storage

Append-only audit trail

External services

Maps & routing

Registry & identity

Fuel & toll

Finance

AI models

KEY TAKEAWAY The interface is a convenience, never the guard. Whatever a client shows or hides, the platform re-checks who is asking, what plan they hold and whose data they are reaching for — and answers a cross-organization request as though the record did not exist.

What Saarthi does not build for itself.

Saarthi

PLATFORM CORE

Owns the business record and the decisions made against it. Everything on the right is consulted, never trusted to hold the truth.

CONFIDENTIALITY

No keys, accounts, endpoints or configuration appear in this document. Each integration is described only by what it is and why it is used.

Maps & basemap

LIVE

Vector tiles, 3D building footprints and real elevation, from open data. Needs no account and carries no request limit, so the map works for every user from the first minute.

OpenFreeMap OpenStreetMap Open elevation data

Routing & search

KEY NEEDED

Truck-aware routes that respect height, weight and access limits, plus turn-by-turn guidance, road snapping and place search. A free tier covers development.

OpenRouteService

Vehicle & driver records

KEY NEEDED

Looks up a vehicle by its registration and a driver by their licence, so onboarding starts from what the authorities already hold rather than from what somebody types.

Registry lookup service Identity document checks

Fuel prices & stations

LIVE

Published city fuel rates and a directory of petrol and CNG stations, so a driver at the roadside sees what is nearby and what it should cost.

Published rate source Station directory

Toll & FASTag

PARTLY LIVE

Tag status, balance and crossings, so a low balance or a blacklisted tag is a warning before it becomes a vehicle stopped at a plaza. Live national lookup needs an account.

NETC lookup Statement import

Telematics hardware

LIVE

On-board diagnostic units, multi-camera recorders and Android phones all report through one gateway, so the platform cannot tell — and does not need to — which kind sent a position.

OBD telematics Multi-camera recorder Phone as device

AI models

LIVE

Powers the Copilot and the recommendations. A local analyst provider is the default and never invents a figure, so the whole path works without an external model behind it.

Anthropic Google Gemini Local analyst

Payments

PLANNED

The interface, the ledger and the order flow exist and run end to end against a simulated provider. A regulated gateway is the remaining piece before real money moves.

Gateway interface ready

KEY TAKEAWAY An outside service can be slow, wrong or unreachable. Every integration has a defined behaviour for that case — a straight-line estimate, a cached answer, a clearly labelled gap — because a driver at the roadside is better served by an honest approximation than by a spinner.

Where each part of the product actually stands.

● **Currently available** — working, in use, enforced ● **Partially available** — works, with a stated limit ● **Planned / future** — not reachable yet

24 PRODUCT AREAS

● Accounts & access Roles, organizations, plans and limits, all enforced by the server.	● Verification & documents Review queue, versioning and an expiry engine that warns before it bites.	● Vehicles & drivers Records, assignments and history across ten vehicle types.	● Marketplace & bidding Material, freight, cab and tour needs on one front door.
● Orders & trips Full lifecycle with states the platform refuses to skip.	● Live tracking & replay One ingestion path for hardware, phone and simulator alike.	● Maps 3D terrain and buildings, five basemaps, no account required.	● Navigation & search Turn-by-turn and place search need a free third-party key.
● SOS & association network Expanding-radius responder matching. Never gated by a plan.	● Driver scoring Every change to a score carries the reason that caused it.	● Maintenance & service Jobs, invoices, parts, warranty and repeat-component detection.	● Loans & EMI Schedules, reminders and a repayment ledger per vehicle.
● Toll & FASTag Crossings, spend and statements work; live tag lookup needs an account.	● QR identity Per-field privacy policy, masked and enforced on the server.	● Devices & telemetry Enrolment, pairing, live readings, history and alerts.	● In-cab cameras Channels and access logging exist; live view needs a video gateway.
● Travel & tours Packages, bookings and cab hire on the same fleet tooling.	● Analytics & AI Copilot Computed from records; every answer cites what it used.	● Sales & referrals Leads, demos, tracker custody and commission arithmetic.	● Vehicle Terminal & Device apps Two Android products: the in-cab cockpit and the phone device client.
● Payments Quote, order and ledger run end to end against a simulated provider.	● Resale marketplace Built and tested, deliberately held behind a switch until launch.	● API access & single sign-on Defined as entitlements; no surface built against them yet.	● Production hardening Object storage, real notification delivery and observability.

KEY TAKEAWAY Nothing in the product is faked to look finished. Where a capability depends on something not yet in place, the interface says so rather than showing a plausible number — which is why this board has amber on it at all.

The short version, before you open anything.

PRODUCT

It is a record, not a dashboard

Saarthi holds the operating record of a transport business — the work, the vehicles, the people, the money and the paperwork. Live location is one of the things that record knows, not the point of the product. Capacity is bought a vehicle at a time, so the record fits an owner with one van as well as an operator with ninety.

USERS

Both sides of every job are on it

Fleets, suppliers and travel operators supply; customers buy; drivers do the work; associations respond to trouble; admins keep the network honest. The same job is visible to each of them, in the detail their role allows.

CORE WORKFLOWS

Three loops carry most of the value

- **Win work** — requirement, bid, award, order, trip, delivered.
- **Run the vehicle** — pair, check, drive, report, complete.
- **Stay legal and solvent** — documents, expiry, EMI, toll, fuel, service.

TECHNOLOGY

One language, one set of rules

TypeScript across the web platform and its services, Kotlin on the vehicle, PostgreSQL as the record. Business rules live in one shared package used by server and browser alike, and every outside service sits behind a swappable interface.

BEFORE YOU START Read a rule where it is defined rather than where it is used. Almost every question of the form “is this allowed?” is answered in one shared place, and almost every question of the form “what happened?” is answered by the record rather than by a log.

Terms you will hear on day one

Requirement	What a customer needs, before anyone has agreed to supply it. Four kinds: material, freight, cab, tour.
Bid	An offer against a requirement. One requirement can attract an offer for the goods and a separate one to move them.
Order / Booking	What an awarded bid turns into — an order for goods and freight, a booking for passengers.
Trip	A named vehicle and driver actually moving against a job, with its own lifecycle and history.
Entitlement	The resolved set of capabilities an account holds — the answer to “may this organization do this?”
Tracker	Fitted hardware, or a phone acting as one. Unlocks telemetry no plan sells, because it is earned by hardware rather than by price.
Terminal	The tablet fitted in the cab. Its state is owned by the server, so a driver cannot reach a screen the vehicle disagrees with.
Association	A district body that answers roadside emergencies. Sees that a vehicle nearby needs help, and nothing more.

CURRENT FOCUS

What the project has been working on

Vehicle Terminal app

Sales & referral layer

Plans and pricing

Multilingual rollout

Hardware integration

Deployment

Next is the commerce and payments layer: a regulated gateway behind the interface that already exists, and settlement across marketplace, procurement and travel.

The operating system for everything you move.

Freight and passengers, one vehicle or two hundred — supply, demand, the road between them and the paperwork around all three, held in one place.

WHO USES IT

Fleet owners Drivers Customers
Suppliers Travel operators Associations
Admins

WHAT IT DOES

Marketplace Trips & dispatch Live tracking
Safety & SOS Documents Money & toll
Telemetry Analytics & AI

WHAT IT RUNS ON

Web platform Vehicle Terminal Device app
Fitted hardware 23 languages

One shared record

Every screen, every app and every device writes into the same operational record, and every rule about who may do what is decided once and enforced by the server — not by the interface that happens to be asking.

DATA & INTEGRATIONS

Operational database Cache & live channels Document storage Maps & routing Registry & identity Fuel, toll & finance AI models
Telematics

Work that gets won

A fleet with a spare vehicle and a customer with a load can find each other without a broker in between, and the return leg stops running empty.

Vehicles that keep earning

Nothing expires unnoticed, nothing is serviced twice, and the cost of running each vehicle comes from its own records rather than a monthly guess.

People who get home

Help is one tap away and reaches whoever is actually nearby — the fleet, another Saarthi vehicle, and the district association at once.

Welcome to the project. **Now go and open the map.**
